Abstract :

The SpinQuest experiment at Fermilab aims to extract Sivers functions for the \bar{u} and \bar{d} sea quarks in the range of $0.1 < x_B < 0.5$ through single spin asymmetry measurements of dimuon pairs resulting from the Drell-Yan process. The proposed beam intensity is 1.5×10^{12} of 120 GeV unpolarized proton/sec. The experiment utilizes a transversely polarized fixed target system which consists of a 5T superconducting magnet, NH_3 and ND_3 targets, a ^4He evaporation refrigerator, a 140 GHz microwave source and a large pumping system. The expected average target polarization is 80% for protons, and 32% for deuterons. The polarization will be measured using Q-meter based NMR system. An overview of the polarized target system, including polarization measurements will be presented in this talk.
