Embed Mandala Video Assets in UVACollab

You can embed Mandala Audio-Video and Visuals resources in your own website with iFrames. An iFrame lets you add HTML content within another HTML page. This tutorial will walk you through the four steps necessary to embed Mandala AV assets in your Collab site:

1. Find and copy your video's iFrame code

2. Create an HTML page in UVACollab

3. Paste the iFrame you copied from Mandala onto the HTML page

4. Save your new page and notify your students that it exists

1. Find and copy your video's iFrame code

1. Log in to https://audio-video.shanti.virginia.edu/
   - Learn how at Log in to Audio-Video

2. Open the **Main Menu** again
   Click **My Content**, then **My Collections**
   - You'll see a list of all the collections that belong to you

4. Choose the collection which contains the video you want to embed
   - The collection will open

5. Open the video you want to embed
   - The video and its metadata will open

6. Click the **Share icon** in the bottom right corner of the video display
   - This icon looks like a network

   - An overlay with sharing options will open over the video:

7. Copy the code in the bottom box, labeled **</>**
   - Keep this somewhere safe; you'll need it later

2. Create an HTML page in UVACollab

1. Open the course where you want to embed the video at https://collab.its.virginia.edu
   - Get help using this external UVACollab guide
2. Select **Resources** from the Tools Menu on the left side of the page
   - You should see a list of your resource folders
3. Next to the folder for your course, click **Actions**
4. Select **Create HTML Page**
   - Follow the prompts to name and create your new page

3. Paste the iFrame you copied from Mandala onto the HTML page

1. Select the **Source** button at the top left corner of the editor
2. Paste your iFrame code
3. Click **Continue**

> ⓘ After entering text or other content into the editor in UVACollab, we recommend using the Accessibility Checker to confirm that the content is fully accessible to all site participants. See How do I check my content for accessibility? for more information on the Accessibility Checker and instructions for checking content.

4. Save your new page and notify your students that it exists

1. Enter a *File Name* for the HTML page in the box provided.
   - You can add other details as you need them, including descriptions, access information, and more. For help with optional file details, see these guides from UVaCollab:
     - How do I add and display more information about a file or folder in Resources or File Drop?
     - How do I hide Resources files and folders?
     - How do I set the display of a Resources item to a specific time period?
2. If you want, you can send an automatic email notification to site participants with a link to the page

- By default, **No notification** is sent
  - Select **High - All participants** to send an email to everyone in your UVACollab site who can access the file
  - Select **Low - Not received by those who have opted out** to send an email only to those who have chosen to receive *Resources* notifications in their preferences
- If the file is created in a folder that is only available to a specific group, only members of that group will receive the email notification.

3. Click **Finish**
   - Your new page will appear

If you need to update this page or add more content, return to your course **Resources** page. Next to the page you created, click **Actions** > **Edit Content.**
