

Page Types

A *page* is the smallest unit of Confluence. When you create a guide for the Knowledge Base, you're assembling a series of pages. We've developed *page types* (categories or taxonomies of pages) to target specific user needs. Each page type plays a unique role in helping users learn our applications.

Page Type	Purpose
Glossary definition	Defines a word in the application guide.
Step-by-step guide	Guides users through a quick, granular task within the application.
Orientation guide	Provides non-linear information users need to understand an application.
Tutorial	Guides users through longer, more involved or advanced tasks within an application.
Branch page	Groups together pages under one broader section.
Landing page	Presents the application and the content of the application guide.
App Companion	

Check out our [content model guide](#) to see how these page types work together. The links in the first column above provide more in-depth information about each page type.
