

Audio-Video (definition)

Audio-Video lets you make and manage audio and video files within the Mandala Suite. You can upload an unlimited number of items.

Audio-Video's metadata capabilities makes it particularly useful for scholars. Audiovisual information fields follow the [PBCore metadata schema](#), a widely-used metadata standard for broadcasting. In addition, Mandala's [Knowledge Maps](#) let scholars use labels to connect related media items.

Once you've added your files, you can find them with the search function. Tracking your workflow for files can help you make collaborative archive projects.
